ON A HIGHER ORDER TWO DIMENSIONAL THERMOELASTIC SYSTEM COMBINING A LOCAL AND NONLOCAL BOUNDARY CONDITIONS

SAID MESLOUB

ABSTRACT. Due to their importance and numerous applications, evolution mixed problems with nonlocal constraints in the boundary conditions have been extensively studied during the two last decades. In this paper, we consider an initial boundary value problem for a higher order thermoelastic system arising in linear thermoelasticity which combines some Dirichlet and weighted integral boundary conditions. The studied system modelizes in general a Kirchhoff plate. We prove the well posedness of the given problem. Our proofs are mainly based on some a priori bounds in some Sobolev type space functions and on some density arguments.

1. Introduction

During the few last decades, many researchers have studied linear and nonlinear systems of thermoelastic equations and many results have been published. Most of these results were dealing with the study of existence, asymptotic behavior, regularity, controllability, propagation of singularities and blow up of solutions. For example Assila [1], has studied global existence and asymptotic behavior of solutions for a purely linear multidimensional system of nonhomogeneous and anisotropic thermoelasticity, associated with nonlinear boundary conditions. Dafermos and Hsiao [4], Hrusa and Messaoudi [6], Munoz-Rivera [15], Racke [16], Racke and Shibata [17] and Slemrod[19] have studied and obtained some results about the existence, regularity, controllability and long-time behavior of some systems of thermoelasticity. Also Racke and Wang [18] have considered some linear and semilinear Cauchy problems and described the propagation of singularities. Mixed problems for thermoelastic systems become very hard to handle in case of the presence of nonlocal constraints in the boundary (such

\textit{Key words and phrases.} Thermoelastic System, integral condition, Energy Inequality, Existence, Uniqueness, Weak solution

\textit{2000 Mathematics Subject Classification:} 35L70, 35L20, 35K, 35R.
as an integral condition instead of a Dirichlet or Neumann classical condition). There are two types of nonlocal problems, spatial nonlocal problems and time nonlocal problems. These type of mixed problems, arise mainly when the data on the boundary cannot be measured directly, but it can be replaced by a nonlocal condition such as an integral condition. Physically, this kind of condition can represent a mean, a total energy or a total mass. Boundary value problems with nonlocal constraints have many important applications such as in groundwater flow, population dynamics, chemical diffusion, thermoelasticity, heat conduction processes, certain biological processes, nuclear reactor dynamics, control theory, medical science, biochemistry, and transmission theory. Nonlocal problems were first investigated by using the method of separation of variables and the corresponding eigenvalues and eigenfunctions were considered. Later on, other methods such as the functional analysis method, the energetic method and the method of singular integral equations were applied to mixed nonlocal problems but with great difficulties. For some nonlocal mixed problems for parabolic and hyperbolic equations the reader should refer to Mesloub [7,8,9,10], Mesloub and Mesloub.F [12], Mesloub and Messaoudi [13] and Mesloub and Bouziani [11].

Motivated by the previous studies, we consider the following initial boundary value problem for a fourth order two dimensional linear thermoelastic system with Dirichlet and nonlocal constraints of integral type:

\[
\begin{aligned}
L_1 u &= \frac{\partial^2 u}{\partial t^2} + \Delta^2 u - \alpha \Delta \theta + c_1 u + c_2 u_t = f(x, y, t), \quad (x, y, t) \in Q, \\
L_2 \theta &= \beta \frac{\partial \theta}{\partial t} - \eta \Delta \theta + \sigma \theta + \alpha \Delta u_t = g(x, y, t), \quad (x, y, t) \in Q, \\
u(x, y, 0) &= u_0(x, y), \quad u_t(x, y, 0) = u_1(x, y), \quad \theta(x, y, 0) = \theta_0(x, y), \\
u(0, y, t) &= 0, \quad u(a, y, t) = 0, \quad 0 < y < b, \quad 0 < t < T; \\
u(x, 0, t) &= 0, \quad u(x, b, t) = 0, \quad 0 < x < a, \quad 0 < t < T, \\
\int_0^a x^k u dx &= 0, \quad \int_0^b y^k u dy = 0, \quad \int_0^a x^k \theta dx = 0, \quad \int_0^b y^k \theta dy = 0, \quad k = 0, 1.
\end{aligned}
\]

(1)

where \(Q = \Omega \times [0, T]\), with \(\Omega = (0, a) \times (0, b), \ T < \infty, \ a < \infty\) and \(b < \infty\).

The given data satisfy the consistency conditions

\[
\begin{aligned}
u_0(0, y) &= u_0(a, y) = u_0(x, 0) = u_0(x, b) = 0, \\
u_1(0, y) &= u_1(a, y) = u_1(x, 0) = u_1(x, b) = 0.
\end{aligned}
\]

(2)

EJQTDE, 2012 No. 50, p. 2
and
\[
\int_0^a x^k u_\circ dx = 0, \quad \int_0^b y^k u_\circ dy = 0, \quad \int_0^a x^k u_1 dx = 0, \quad \int_0^b y^k u_1 dy = 0, \quad k = 0, 1.
\]

Problem (1) arises in linear thermoelasticity. It models a Kirchoff plate, where \( u \) is the displacement, \( \theta \) is the thermal damping. The integral conditions may be interpreted as the average and the weighted average of the displacement and the thermal damping, and \( \alpha, \beta, \eta, \sigma, c_1 \) and \( c_2 \) are positive constants.

On the basis of some a priori bounds, energy estimates and some density arguments, we prove the existence, uniqueness and the continuous dependence of the solution on the data of the given problem (1). The paper is organized as follows: In section 1, we start by an introduction about previous and related results concerning the subject. In section 2, we introduce some notations, function spaces and reformulation of the studied problem. Section 3 is devoted to the study of uniqueness of the solution of the stated problem. In the fourth and last section, we establish the existence of the weak solution of our problem and give some remarks. At the end of the paper, we give a list of some used references.

2. Notations, functional frame, some auxiliary inequalities and reformulation of the problem

We denote by \( L^2(Q) \) the usual square integrable functions space, and by \( W^{1,0}_2(Q) \) the Sobolev space having the inner product
\[
(u, v)_{W^{1,0}_2(Q)} = (u, v)_{L^2(Q)} + (u_x, v_x)_{L^2(Q)}.
\]

Let \( B^m_a(0, a) \) (See [2,3]) be the space constituted of functions \( u \in L^2(0, a) \), if \( m = 0 \) and of functions \( u \) such that \( \mathbb{Q}_x^m u \in L^2(0, a) \), if \( m \geq 1 \), where
\[
\mathbb{Q}_x^m V = \frac{1}{(m-1)!} \int_0^x (x-\xi)^{m-1} V(\xi, t) d\xi = \int \int \int V(\eta, t) dy d\xi_{m-1} ... d\xi_1,
\]
\( \text{EJQTDE, 2012 No. 50, p. 3} \).
with inner product \((u, v)_{B_2^m(0,a)} = \int_0^a \mathcal{S}_x^m u \mathcal{S}_x^m v \, dx\), and associated norm
\[
\|u\|_{B_2^m(0,a)} = \|\mathcal{S}_x^m u\|_{L^2(0,a)}, \text{ for } m \geq 1.
\]

We also use the function spaces \(C(I, B_2^m(\Omega))\), \(C(I, B_2^{1,x}(\Omega))\), \(C(I, B_2^{1,y}(\Omega))\)
and \(C(I, B_2^{1,x,y}(\Omega))\) of continuous mappings from \(I = [0, T]\) onto the
Hilbert spaces \(B_2^m(\Omega)\), \(B_2^{1,x}(\Omega)\), \(B_2^{1,y}(\Omega)\), and \(B_2^{1,x,y}(\Omega)\) respectively,
and with inner products (respectively) given by
\[
(u, v)_{B_2^m(\Omega)} = \int_{\Omega} \mathcal{S}_x^m u \mathcal{S}_x^m v \, dx, \quad (u, v)_{B_2^{1,x}(\Omega)} = \int_{\Omega} \mathcal{S}_x u \mathcal{S}_x v \, dx,
\]
\[
(u, v)_{B_2^{1,y}(\Omega)} = \int_{\Omega} \mathcal{S}_y u \mathcal{S}_y v \, dx, \quad (u, v)_{B_2^{1,x,y}(\Omega)} = \int_{\Omega} \mathcal{S}_{xy} u \mathcal{S}_{xy} v \, dx.
\]

The following inequalities are used in our paper:

A) For every \(u \in L^2(\Lambda)\) (\(\Lambda\) is either \((0, d)\) or \(\Omega\)) and all \(m \in \mathbb{N}^*\), we have the inequalities
\[
\|h\|_{B_2^m(0,d)}^2 \leq \frac{d^2}{2} \|h\|_{B_2^{m-1}(0,d)}^2 \quad (1^*)
\]
and
\[
\|h\|_{B_2^m(0,d)}^2 \leq \left(\frac{d^2}{2}\right)^m \|h\|_{L^2(0,d)}^2, \quad (2^*)
\]
\[
\|\mathcal{S}_x u\|_{L^2(\Omega)}^2 \leq \frac{a^2}{2} \|u\|_{L^2(\Omega)}^2 \quad (3^*)
\]
\[
\|h\|_{B_2^{1,x,y}(\Omega)}^2 = \|\mathcal{S}_{xy} h\|_{L^2(\Omega)}^2 \leq \frac{(ab)^2}{4} \|h\|_{L^2(\Omega)}^2, \quad (4^*)
\]

B) Growall’s Lemma [5, Lemma 7.1]. If \(f_1(s), f_2(s)\) and \(f_3(s)\) are nonnegative functions on \((0, T), f_1(s)\) and \(f_2(s)\) integrable functions, and \(f_3(s)\) is nondecreasing on \((0, T)\), then if
\[
\int_0^s f_1(t) \, dt + f_2(s) \leq c \left(\int_0^s f_2(t) \, dt + f_3(s)\right),
\]
then \(\int_0^s f_1(t) \, dt + f_2(s) \leq \exp(c s) f_3(s)\).

C) Cauchy \(\varepsilon\)–inequality: For all \(\varepsilon > 0,\) and for arbitrary \(a, b\) in \(\mathbb{R}\), we have
\[
|ab| \leq \frac{\varepsilon}{2} |a|^2 + \frac{1}{2\varepsilon} |b|^2.
\]

Let us now formulate problem (1) in its operator form. Problem
(1) can be viewed as the problem of solving the operator equation:
\(JU = G\), with \(U = (u, \theta), JU = (J_1u, J_2\theta)\), and \(G = (G_1, G_2) = (\{f, u_o, u_1\}, \{g, \theta_o\})\), where
\[ J_1 u = \{ \mathcal{L}_1 u, \ell_1 u, \ell_2 u \}, \quad J_2 \theta = \{ \mathcal{L}_2 \theta, \ell_3 \theta \}. \]

The unbounded operator \( A \) is considered on the Banach space \( B \) into a Hilbert space \( H \) with domain \( D(J) \) defined by
\[
D(J) = \left\{ U = (u, \theta) \in (L^2(Q))^2 \text{ such that } u_t, \theta_t, u_{tt}, \frac{\partial^2 u}{\partial x^2}, \frac{\partial^2 u}{\partial y^2}, u_{tx}, u_{ty}, u_{tyy} \in L^2(Q), \quad i = 1, 2, 3, 4 \right\}
\]
and the functions \( U = (u, \theta) \) satisfy boundary conditions in (1). Here \( B \) is the Banach space obtained by enclosing \( D(J) \) with respect to the finite norm
\[
\| U \|_B = \left( \| u_t(\cdot, \cdot, \tau) \|_{C(I, B^2_{1,x,y}(\Omega))}^2 + \| u(\cdot, \cdot, \tau) \|_{C(I, B^2_{1,x,y}(\Omega))}^2 + \| u(x, \cdot, \tau) \|_{C(I, B^2_{1,x,y}(\Omega))}^2 + \| \theta(\cdot, \cdot, \tau) \|_{C(I, B^2_{1,x,y}(\Omega))}^2 \right)^{1/2}
\]
where
\[
\mathcal{S}_x u = \int_0^x u(\xi, y, t) d\xi, \quad \mathcal{S}_{xy} u = \int_0^x \int_0^y u(\xi, \eta, t) dy d\xi.
\]
The elements \( U = (u, \theta) \in B \) are the set of continuous functions \( u \) and \( \theta \) on \( I = [0, T] \), where functions \( u \) have values in \( B^2_{1,x}(\Omega), B^2_{1,y}(\Omega) \) and have derivatives \( u_i \) which are continuous on \( I \) with values in \( B^2_{1,x,y}(\Omega) \) and \( \theta \) have values in \( B^2_{1,x,y}(\Omega) \).

Let \( H = H_1 \times H_2 \) be the Hilbert space \( \{ L^2(Q) \times W^1_2(\Omega) \times L^2(\Omega) \} \times \{ L^2(Q) \times L^2(\Omega) \} \) having the finite norm
\[
\| G \|_H^2 = \| f \|_{L^2(Q)}^2 + \| u_0 \|_{W^1_2(\Omega)}^2 + \| u_1 \|_{L^2(\Omega)}^2 + \| g \|_{L^2(Q)}^2 + \| \theta_0 \|_{L^2(\Omega)}^2.
\]

3. Uniqueness of solution

We now state the first result concerning the uniqueness of solution of problem (1).

**Theorem 1.** For any function \( U = (u, \theta) \in D(J) \), there exists a positive constant \( C > 0 \) independent of \( U \), such that
\[
\| U \|_B^2 - C \| JU \|_H^2 \leq 0.
\]
Proof. Taking the inner product in $L^2(Q_T)$ of equations $L_1 u = f$, $L_2 u = g$ and the integrodifferential operators $\mathcal{A}_{xy} u_t$ and $\mathcal{A}_{xy} \theta$, respectively, where $Q_T = (0, \tau) \times \Omega$ with $0 \leq \tau \leq T$, we have

$$c_1 (u, \mathcal{A}_{xy} u_t)_{L^2(Q_T)} + c_2 (u_t, \mathcal{A}_{xy} u_t)_{L^2(Q_T)} + (u_t, \mathcal{A}_{xy} u_t)_{L^2(Q_T)}$$

$$+ \left( \frac{\partial^4 u}{\partial x^4}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} + 2 \left( \frac{\partial^4 u}{\partial x^2 \partial y^2}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} + \left( \frac{\partial^3 u}{\partial y^3}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)}$$

$$- \alpha \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} - \alpha \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} + \beta (\theta, \mathcal{A}_{xy} \theta)_{L^2(Q_T)}$$

$$- \eta \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{A}_{xy} \theta \right)_{L^2(Q_T)} - \eta \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{A}_{xy} \theta \right)_{L^2(Q_T)}$$

$$+ \sigma (\theta, \mathcal{A}_{xy} \theta)_{L^2(Q_T)} + \alpha \left( \frac{\partial^3 u}{\partial y^3}, \mathcal{A}_{xy} \theta \right)_{L^2(Q_T)} + \alpha \left( \frac{\partial^3 u}{\partial y^3}, \mathcal{A}_{xy} \theta \right)_{L^2(Q_T)}$$

$$= (f, \mathcal{A}_{xy} u_t)_{L^2(Q_T)} + (g, \mathcal{A}_{xy} \theta)_{L^2(Q_T)}.$$  \hspace{1cm} (8)

By successive integration by parts of each term of (8), and using boundary conditions in (1), we derive the following equalities:

$$c_1 (u, \mathcal{A}_{xy} u_t)_{L^2(Q_T)} = \frac{c_1}{2} \left\| \mathcal{A}_{xy} u(., ., \tau) \right\|_{L^2(\Omega)}^2 - \frac{c_2}{2} \left\| \mathcal{A}_{xy} u_0 \right\|_{L^2(\Omega)}^2,  \hspace{1cm} (9)$$

$$c_2 (u_t, \mathcal{A}_{xy} u_t)_{L^2(Q_T)} = c_2 \left\| \mathcal{A}_{xy} u_t \right\|_{L^2(Q_T)}^2,  \hspace{1cm} (10)$$

$$\left( \frac{\partial^4 u}{\partial x^4}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} = \frac{1}{2} \left\| \mathcal{A}_{xy} u_t(., ., \tau) \right\|_{L^2(\Omega)}^2 - \frac{1}{2} \left\| \mathcal{A}_{xy} u_1 \right\|_{L^2(\Omega)}^2,  \hspace{1cm} (11)$$

$$2 \left( \frac{\partial^4 u}{\partial x^2 \partial y^2}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} = \left\| u(x, y, \tau) \right\|_{L^2(\Omega)}^2 - \left\| u_0 \right\|_{L^2(\Omega)}^2,  \hspace{1cm} (12)$$

$$\left( \frac{\partial^4 u}{\partial y^4}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} = \frac{1}{2} \left\| \mathcal{A}_{xy} u_t(., ., \tau) \right\|_{L^2(\Omega)}^2 - \frac{1}{2} \left\| \mathcal{A}_{xy} u_0 \right\|_{L^2(\Omega)}^2,  \hspace{1cm} (13)$$

$$- \alpha \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)} = \alpha \left( \mathcal{A}_{xy} \theta, \mathcal{A}_{xy} u_t \right)_{L^2(Q_T)}.$$  \hspace{1cm} (15)

EJQTDE, 2012 No. 50, p. 6
\[-\alpha \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy} u_t \right)_{L^2(Q_r)} = \alpha (\mathcal{S}_x \theta, \mathcal{S}_x u_t)_{L^2(Q_r)}, \quad (16)\]

\[\beta(\theta_t, \mathcal{S}_{xy} \theta)_{L^2(Q_r)} = \frac{\beta}{2} \|\mathcal{S}_{xy} \theta(\cdot, \cdot, \tau)\|_{L^2(\Omega)}^2 - \frac{\beta}{2} \|\mathcal{S}_{xy} \theta_0\|_{L^2(\Omega)}^2, \quad (17)\]

\[-\eta \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{S}_{xy} \theta \right)_{L^2(Q_r)} = \eta \|\mathcal{S}_y \theta\|_{L^2(Q_r)}^2, \quad (18)\]

\[-\eta \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy} \theta \right)_{L^2(Q_r)} = \eta \|\mathcal{S}_x \theta\|_{L^2(Q_r)}^2, \quad (19)\]

\[\sigma(\theta, \mathcal{S}_{xy} \theta)_{L^2(Q_r)} = \sigma \|\mathcal{S}_x \theta\|_{L^2(Q_r)}^2, \quad (20)\]

\[\alpha \left( \frac{\partial^3 u}{\partial x^2 \partial t}, \mathcal{S}_{xy} \theta \right)_{L^2(Q_r)} = -\alpha (\mathcal{S}_y u_t, \mathcal{S}_y \theta)_{L^2(Q_r)}, \quad (21)\]

\[\alpha \left( \frac{\partial^3 u}{\partial y^2 \partial t}, \mathcal{S}_{xy} \theta \right)_{L^2(Q_r)} = -\alpha (\mathcal{S}_x u_t, \mathcal{S}_x \theta)_{L^2(Q_r)}, \quad (22)\]

\[(f, \mathcal{S}_{xy} u_t)_{L^2(Q_r)} = (\mathcal{S}_{xy} f, \mathcal{S}_{xy} u_t)_{L^2(Q_r)}, \quad (23)\]

\[(g, \mathcal{S}_{xy} \theta)_{L^2(Q_r)} = (\mathcal{S}_{xy} g, \mathcal{S}_{xy} \theta)_{L^2(Q_r)}. \quad (24)\]

If we use Cauchy–e– inequality given in C), Poincare’ inequality of type (4*), and equalities (9) – (24), then equation (8) reduces to

\[\|\mathcal{S}_{xy} u(\cdot, \cdot, \tau)\|_{L^2(\Omega)}^2 + \|\mathcal{S}_{xy} u_t(\cdot, \cdot, \tau)\|_{L^2(\Omega)}^2 + \|\mathcal{S}_x u(\cdot, y, \tau)\|_{L^2(\Omega)}^2 + \|\mathcal{S}_y u(x, \cdot, \tau)\|_{L^2(\Omega)}^2 + \|\mathcal{S}_x u_t\|_{L^2(Q_r)}^2 + \|\mathcal{S}_y u_t\|_{L^2(Q_r)}^2 + \|\mathcal{S}_x \theta(\cdot, \cdot, \tau)\|_{L^2(\Omega)}^2 + \|\mathcal{S}_y \theta(\cdot, \cdot, \tau)\|_{L^2(\Omega)}^2 \leq C_1 \left( \|u_1\|_{L^2(\Omega)}^2 + \|u_0\|_{L^2(\Omega)}^2 + \left\| \frac{\partial u_0}{\partial x} \right\|_{L^2(\Omega)}^2 + \left\| \frac{\partial u_0}{\partial y} \right\|_{L^2(\Omega)}^2 + \|\theta_0\|_{L^2(\Omega)}^2 + \|f\|_{L^2(Q_r)}^2 + \|g\|_{L^2(Q_r)}^2 + \|\mathcal{S}_{xy} u_t\|_{L^2(Q_r)}^2 + \|\mathcal{S}_{xy} \theta\|_{L^2(Q_r)}^2 \right) \quad (25)\]

where

\[C_1 = \max \left\{ 1, \frac{a^2}{4}, \frac{b^2}{4}, \frac{(ab)^2}{8}, \frac{\beta(ab)^2}{8}, \frac{c_1}{2} \right\} \quad \text{and} \quad \min \left\{ \frac{a^2}{4}, \frac{b^2}{4}, \frac{c_1}{2} \right\} \quad \text{EJQTDE, 2012 No. 50, p. 7}\]
Applying the Gronwall’s lemma given in B) to inequality (25) and discarding the fourth, sixth and seventh term of its left-hand, we obtain

\[
\begin{align*}
\| \mathcal{S}_{xy} u(\cdot, \tau) \|^2_{L^2(\Omega)} + \| \mathcal{S}_{xy} u_t(\cdot, \tau) \|^2_{L^2(\Omega)} + \| \mathcal{S}_x u(\cdot, y, \tau) \|^2_{L^2(\Omega)} \\
+ \| \mathcal{S}_y u(x, \tau) \|^2_{L^2(\Omega)} + \| \mathcal{S}_x \theta(\cdot, \tau) \|^2_{L^2(\Omega)} \\
\leq C_1 e^{C_1 T} \left( \| u_1 \|^2_{L^2(\Omega)} + \| u_0 \|^2_{W^1_2(\Omega)} + \| \theta_0 \|^2_{L^2(\Omega)} \\
+ \| f \|^2_{L^2(\Omega)} + \| g \|^2_{L^2(\Omega)} \right). \tag{26}
\end{align*}
\]

Each term on the left-hand side of (26) is bounded and since the right-hand of the above inequality (26) is independent of \( \tau \), we can take the least upper bound of each term of the left-hand side with respect to \( \tau \) over \([0, T]\), we get the desired estimate (7) with \( C = C_1 e^{C_1 T} \). This completes the proof of Theorem 1.

It can be proved in a standard way that the operator \( J: B \to H = H_1 \times H_2 \) is closable.

**Proposition 2.** The operator \( J: B \to H = H_1 \times H_2 \) has a closure See [15].

Let \( \overline{J} \) be the closure of \( J \) and \( D(\overline{J}) \) its domain of definition. We define the strong generalized solution of problem (1) as the solution of the operator equation \( \overline{J} U = (J_1 u, J_2 \theta) \), with \( J_1 u = \{ L_1 u, \ell_1 u, \ell_2 u \} \), \( J_2 \theta = \{ \mathcal{L}_2 \theta, \ell_3 \theta \} \), \( (J_1 u, J_2 \theta) \in H \). If we pass to the limit in (7) we have the result

**Corollary 3.** There exists a positive constant \( C \) such that

\[
\| U \|^2_B - C \| \overline{J} U \|^2_H \leq 0, \quad \forall U \in D(\overline{J}). \tag{27}
\]

We deduce from the a priori estimate (27) that a strong generalized solution of (1) if it exists is unique and depends continuously on \( G = (G_1, G_2) = (\{ f, u_0, u_1 \}, \{ g, \theta_0 \}) \in H \), and that the range \( R(\overline{J}) \) of \( \overline{J} \) is closed in \( H \) and \( R(\overline{J}) = \overline{R(J)} \).

Existence of the solution of the stated problem.

**Theorem 4.** Problem (1) has a unique strong solution verifying

\[
u \in C(I, B_2^{1,x} (\Omega)), \ u \in C(I, B_2^{1,y} (\Omega)), \ \theta \in C(I, B_2^{1,x,y} (\Omega)), \ \frac{\partial u}{\partial t} \in C(I, B_2^{0,x,y} (\Omega)).
\]

EJQTDE, 2012 No. 50, p. 8
Moreover, the functions $\exists_x u$, $\exists_y u$, $\exists_{xy} u$, $\exists_{xy} \theta$ depend continuously on the free terms $f \in L^2(Q)$, $g \in L^2(Q)$, and on the initial data $u_0 \in W^1_2(\Omega)$, $u_1 \in L^2(\Omega)$, $\theta_0 \in L^2(\Omega)$, that is
\[
\|u(\cdot, \cdot, \tau)\|_{C(\tilde{L}^2_1(\Omega))} \leq C \|JU\|_H,
\]
\[
\|u(x, \cdot, \tau)\|_{C(\tilde{L}^2_1(\Omega))} \leq C \|JU\|_H,
\]
\[
\|u(\cdot, y, \tau)\|_{C(\tilde{L}^2_1(\Omega))} \leq C \|JU\|_H,
\]
\[
\|u_t(\cdot, \cdot, \tau)\|_{C(\tilde{L}^2_1(\Omega))} \leq C \|JU\|_H,
\]
\[
\|\theta(\cdot, \cdot, \tau)\|_{C(\tilde{L}^2_1(\Omega))} \leq C \|JU\|_H. \tag{28}
\]

**Proof.** To establish the existence of the solution of problem (1), it is sufficient to prove that the image of the operator $J$ is dense in $H$.

General case for density: Since $H$ is a Hilbert space, $R(J) = H$ is equivalent to the orthogonality of a vector $\Phi = (\mathcal{G}_1, \mathcal{G}_2) = \{\sigma_1, \sigma_2, \sigma_3\}$, $\{\sigma_4, \sigma_5\} \in H$ to the range $R(J)$, that is the equality
\[
\begin{align*}
+ (\ell_2 u, \sigma_4)_{L^2(\Omega)} + (\ell_3 \theta, \sigma_5)_{L^2(\Omega)} \\
+ (L_1 u, \sigma_1)_{L^2(Q)} + (L_2 \theta, \sigma_2)_{L^2(Q)} + (\ell_1 u, \sigma_3)_{W^1_2(\Omega)}
\end{align*}
= 0, \tag{29}
\]
for all $U = (u, \theta) \in D(J)$, implies that $\Phi = 0$. Let $D_0(J)$ be a subset of $D(J)$ for which $\ell_1 u = 0$, $\ell_2 u = 0$, $\ell_3 \theta = 0$. If $U \in D_0(J)$, then (29) reduces to
\[
(L_1 u, \sigma_1)_{L^2(Q)} + (L_2 \theta, \sigma_2)_{L^2(Q)} = 0. \tag{30}
\]
We have to prove that $\Psi = (\sigma_1, \sigma_2) = 0$ everywhere in $Q$. Thus we must prove the following special case (of density) and then go back to the general case.

**Proposition 5.** If, for some function $\Psi = (\sigma_1, \sigma_2) \in (L^2(Q))^2$ and for all elements $U \in D_0(J)$, we have
\[
(L_1 u, \sigma_1)_{L^2(Q)} + (L_2 \theta, \sigma_2)_{L^2(Q)} = 0, \tag{31}
\]
then $\Psi$ vanishes almost everywhere in $Q$.

**Proof.** Since relation (31) holds for any element of $D_0(J)$, we then take an element $U = (u, \theta)$ with a special form given by
\[
U = \begin{cases}
(0, 0), & 0 \leq t \leq s, \\
(\int_s^t (\tau - t) u_{\tau\tau} d\tau, \int_s^t \theta_{\tau} d\tau), & s \leq t \leq T,
\end{cases} \tag{32}
\]
EJQTDE, 2012 No. 50, p. 9
such that \((u_{tt}, \theta_t)\) is a solution of the system

\[
\mathcal{S}_{xy} u_{tt} = E_1(r, t) = \int_t^T \sigma_1(r, \tau) d\tau, \quad \mathcal{S}_{xy} \theta_t = E_2(r, t) = \int_t^T \sigma_2(r, \tau) d\tau, \tag{33}
\]

where \(E_1(x, t) = \int_t^T \sigma_1(r, \tau) d\tau\), and \(E_2(x, t) = \int_t^T \sigma_2(r, \tau) d\tau\). It is clear that

\[
\sigma_1 = -\mathcal{S}_{xy} u_{tt}, \quad \sigma_2 = -\mathcal{S}_{xy} \theta_t. \tag{34}
\]

**Proposition 6.** The function \(\Psi = (\sigma_1, \sigma_2) \in (L^2(Q))^2\) defined in (34) is in \((L^2(Q))^2\).

**Proof.** It can be carried out as in [10].

Now, replacing the functions \(\sigma_1\) and \(\sigma_2\) given by (34) in (31), we obtain

\[
-c_1 (u, \mathcal{S}_{xy} u_{tt})_{L^2(Q)} - c_2 (u_t, \mathcal{S}_{xy} u_{tt})_{L^2(Q)} - (u_{tt}, \mathcal{S}_{xy} u_{tt})_{L^2(Q)} \tag{35}
\]

\[
- \left( \frac{\partial^4 u}{\partial x^4}, \mathcal{S}_{xy} u_{tt} \right)_{L^2(Q)} - \left( \frac{\partial^4 u}{\partial x^2 \partial y^2}, \mathcal{S}_{xy} u_{tt} \right)_{L^2(Q)} - \left( \frac{\partial^4 u}{\partial y^4}, \mathcal{S}_{xy} u_{tt} \right)_{L^2(Q)} + \alpha \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{S}_{xy} u_{tt} \right)_{L^2(Q)}
\]

\[
+ \beta (\theta_t, \mathcal{S}_{xy} \theta_t)_{L^2(Q)} + \eta \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)}
\]

\[
+ \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)} + \sigma (\theta, \mathcal{S}_{xy} \theta_t)_{L^2(Q)}
\]

\[
- \alpha \left( \frac{\partial^3 u}{\partial x^3 \partial t^2}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)} - \alpha \left( \frac{\partial^3 u}{\partial y^3 \partial t^2}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)} = 0
\]

Taking into account the special form of \(U\) given by (32) and (33), using boundary conditions in (1) and integrating by parts each term of (35), gives

\[
-c_1 (u, \mathcal{S}_{xy} u_{tt})_{L^2(Q)} = c_1 \int_{Q_t} \mathcal{S}_{xy} u_{tt} dxdydt
\]

\[
= -c_1 \int_{Q_t} \mathcal{S}_{xy} u_{tt} dxdydt
\]

\[
= \frac{c_1}{2} \left\| \mathcal{S}_{xy} u_{tt} (\cdot, \cdot, \cdot, T) \right\|_{L^2(Q_t)}^2 \tag{36}
\]

EJQTDE, 2012 No. 50, p. 10
\[-c_2 \left( u_t, \mathfrak{S}_{xy} u_{ttt} \right)_{L^2(Q)} = c_2 \int_{Q_s} \mathfrak{S}_x u_t \mathfrak{S}_{xy} u_{ttt} \, dx dy dt \]
\[= -c_2 \int_{Q_s} \mathfrak{S}_{xy} u_t \mathfrak{S}_{xy} u_{ttt} \, dx dy dt \]
\[= c_2 \left\| \mathfrak{S}_{xy} u_t \right\|^2_{L^2(\Omega)}, \quad (37)\]

\[-(u_{tt}, \mathfrak{S}_{xy} u_{ttt})_{L^2(Q)} = \int_{Q_s} \mathfrak{S}_x u_{tt} \mathfrak{S}_{xy} u_{ttt} \, dx dy dt \]
\[= -\int_{Q_s} \mathfrak{S}_{xy} u_{tt} \mathfrak{S}_{xy} u_{ttt} \, dx dy dt \]
\[= \frac{1}{2} \left\| \mathfrak{S}_{xy} u_{ttt} (., ., s) \right\|^2_{L^2(\Omega)}, \quad (38)\]

\[-\left( \frac{\partial^4 u}{\partial x^4}, \mathfrak{S}_{xy} u_{ttt} \right)_{L^2(Q)} = \int_{Q_s} \frac{\partial^3 u}{\partial x^3} \mathfrak{S}_{xy} u_{ttt} \, dx dy dt \]
\[= -\int_{Q_s} \frac{\partial^2 u}{\partial x^2} \mathfrak{S}_y u_{ttt} \, dx dy dt \]
\[= \int_{Q_s} u_x \mathfrak{S}_y^2 u_{ttt} \, dx dy dt \]
\[= -\int_{Q_s} \mathfrak{S}_y u_x \mathfrak{S}_y u_{ttt} \, dx dy dt \]
\[= \int_{Q_s} \mathfrak{S}_y u_{tx} \mathfrak{S}_y u_{ttt} \, dx dy dt \]
\[= \frac{1}{2} \left\| \mathfrak{S}_y u_{tx} (., ., T) \right\|^2_{L^2(\Omega)}, \quad (39)\]
\[-2 \left( \frac{\partial^4 u}{\partial x^2 \partial y^2}, \mathcal{S}_{xy}^2 u_{tt} \right)_{L^2(Q)} = 2 \int_{Q_s} \frac{\partial^4 u}{\partial x \partial y^2} \mathcal{S}_{xy}^2 u_{tt} dxdydt \]

\[= -2 \int_{Q_s} \frac{\partial^3 u}{\partial y^2} \mathcal{S}_{y}^2 u_{tt} dxdydt \]

\[= 2 \int_{Q_s} u_y \mathcal{S}_{y}^2 u_{tt} dxdydt \]

\[= -2 \int_{Q_s} u \mathcal{S}_{y}^2 u_{tt} dxdydt \]

\[= 2 \int_{Q_s} u u_{tt} dxdydt \]

\[= \|u_t(x, y, T)\|_{L^2(\Omega)}^2, \quad (40)\]

\[- \left( \frac{\partial^4 u}{\partial y^4}, \mathcal{S}_{xy}^2 u_{tt} \right)_{L^2(Q)} = \int_{Q_s} \frac{\partial^3 u}{\partial y^2} \mathcal{S}_{xyy}^2 u_{tt} dxdydt \]

\[= \int_{Q_s} u_y \mathcal{S}_{xyy}^2 u_{tt} dxdydt \]

\[= - \int_{Q_s} \mathcal{S}_x u_y \mathcal{S}_{xy}^2 u_{tt} dxdydt \]

\[= \int_{Q_s} \mathcal{S}_x u_{ty} \mathcal{S}_{xy}^2 u_{tt} dxdydt \]

\[= \frac{1}{2} \|\mathcal{S}_x u_{ty}(, y, T)\|_{L^2(\Omega)}^2, \quad (41)\]

\[\alpha \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{S}_{xy}^2 u_{tt} \right)_{L^2(Q)} = -\alpha \int_{Q_s} \theta_x \mathcal{S}_{xyy} u_{tt} dxdydt \]

\[= \alpha \int_{Q_s} \theta \mathcal{S}_y^2 u_{tt} dxdydt \]

\[= -\alpha \int_{Q_s} \mathcal{S}_y \theta \mathcal{S}_y u_{tt} dxdydt \]

\[= \alpha (\mathcal{S}_y \theta_t, \mathcal{S}_y u_{tt})_{L^2(Q_s)}, \quad (42)\]

EJQTDE, 2012 No. 50, p. 12
\[
\begin{align*}
\alpha \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy}^2 u_{tt} \right)_{L^2(Q)} &= -\alpha \int_{Q_s} \theta_y \mathcal{S}_{xxy} u_{tt} dx dy dt \\
&= \alpha \int_{Q_s} \theta \mathcal{S}_x^2 u_{tt} dx dy dt \\
&= -\alpha \int_{Q_s} \mathcal{S}_x \theta \mathcal{S}_x u_{tt} dx dy dt \\
&= \alpha (\mathcal{S}_x \theta, \mathcal{S}_x u_{tt})_{L^2(Q)}, \quad (43)
\end{align*}
\]

\[
\begin{align*}
-\beta \left( \theta_t, \mathcal{S}_{xy}^2 \theta_t u \right)_{L^2(Q)} &= \beta \int_{Q_s} \mathcal{S}_x \theta_t \mathcal{S}_{xy} \theta_t u dx dy dt \\
&= -\beta \int_{Q_s} \mathcal{S}_{xy} \theta_t \mathcal{S}_{xy} \theta_t u dx dy dt \\
&= \frac{\beta}{2} \left\| \mathcal{S}_{xy} \theta_t (\cdot, \cdot, s) \right\|_{L^2(Q)}^2, \quad (44)
\end{align*}
\]

\[
\begin{align*}
\eta \left( \frac{\partial^2 \theta}{\partial x^2}, \mathcal{S}_{xy}^2 \theta_t u \right)_{L^2(Q)} &= -\eta \int_{Q_s} \theta_x \mathcal{S}_{xxy} \theta_t u dx dy dt \\
&= \eta \int_{Q_s} \theta \mathcal{S}_y^2 \theta_t u dx dy dt \\
&= -\eta \int_{Q_s} \mathcal{S}_y \theta \mathcal{S}_y \theta_t u dx dy dt \\
&= \eta \left\| \mathcal{S}_y \theta_t \right\|_{L^2(Q)}^2, \quad (45)
\end{align*}
\]

\[
\begin{align*}
\eta \left( \frac{\partial^2 \theta}{\partial y^2}, \mathcal{S}_{xy}^2 \theta_t u \right)_{L^2(Q)} &= \eta \left\| \mathcal{S}_x \theta_t \right\|_{L^2(Q)}^2, \quad (46)
\end{align*}
\]

\[
\begin{align*}
-\sigma \left( \theta, \mathcal{S}_{xy}^2 \theta_t u \right)_{L^2(Q)} &= \sigma \int_{Q_s} \mathcal{S}_x \theta \mathcal{S}_{xxy} \theta_t u dx dy dt \\
&= -\sigma \int_{Q_s} \mathcal{S}_{xy} \theta \mathcal{S}_{xy} \theta_t u dx dy dt \\
&= \sigma \left\| \mathcal{S}_{xy} \theta_t \right\|_{L^2(Q)}^2, \quad (47)
\end{align*}
\]
-α \left( \frac{\partial^3 u}{\partial x^2 \partial t}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)} = \alpha \int_{Q_s} \frac{\partial^2 u}{\partial x \partial t} \mathcal{S}_{xxy} \theta_t \, dx \, dy \, dt

= -\alpha \int_{Q_s} u_t \mathcal{S}_y \theta_t \, dx \, dy \, dt

= \alpha \int_{Q_s} \mathcal{S}_y u_t \mathcal{S}_y \theta_t \, dx \, dy \, dt

= -\alpha (\mathcal{S}_y u_t, \mathcal{S}_y \theta_t)_{L^2(Q_s)} , \quad (48)

-\alpha \left( \frac{\partial^3 u}{\partial y^2 \partial t}, \mathcal{S}_{xy} \theta_t \right)_{L^2(Q)} = \alpha \int_{Q_s} \frac{\partial^2 u}{\partial y \partial t} \mathcal{S}_{xxy} \theta_t \, dx \, dy \, dt

= -\alpha \int_{Q_s} u_t \mathcal{S}_y \theta_t \, dx \, dy \, dt

= \alpha \int_{Q_s} \mathcal{S}_x u_t \mathcal{S}_x \theta_t \, dx \, dy \, dt

= -\alpha (\mathcal{S}_x u_t, \mathcal{S}_x \theta_t)_{L^2(Q_s)} , \quad (49)

Combining equalities (36) – (49) and (35) we obtain

\begin{align*}
&\frac{1}{2} \| \mathcal{S}_{xy} u_{tt} (s, T) \|_{L^2(\Omega)}^2 + \frac{1}{2} \| \mathcal{S}_y u_{xt} (s, T) \|_{L^2(\Omega)}^2 \\
&+ \| u_{t} (x, y, T) \|_{L^2(\Omega)}^2 + \frac{1}{2} \| \mathcal{S}_x u_{ty} (s, T) \|_{L^2(\Omega)}^2 \\
&+ \frac{\beta}{2} \| \mathcal{S}_{xy} \theta_t (s, s) \|_{L^2(\Omega)}^2 + \eta \| \mathcal{S}_y \theta_t \|_{L^2(Q_s)}^2 \\
&+ \eta \| \mathcal{S}_x \theta_t \|_{L^2(Q_s)}^2 + \sigma \| \mathcal{S}_{xy} \theta_t \|_{L^2(Q_s)}^2 + \frac{c_1}{2} \| \mathcal{S}_{xy} u_t (s, T) \|_{L^2(\Omega)}^2 \\
&+ c_2 \| \mathcal{S}_{xy} u_{tt} \|_{L^2(\Omega)}^2 \\
&= 0 , \quad (50)
\end{align*}

where \( Q_s = \Omega \times (s, T) \).

Equality (50) implies that \( \mathcal{S}_{xy} u_{tt} (\zeta, \zeta, s) = 0 \) on \( \Omega \), and \( \mathcal{S}_{xy} \theta_t = 0 \) on \( Q_s \), hence we deduce that \( \Psi = (\sigma_1, \sigma_2) = (0, 0) \) almost everywhere in \( Q_s \).

Proceeding in this way step by step, we prove that \( \Psi = 0 \) almost every where in \( Q \).

EJQTDE, 2012 No. 50, p. 14
Now back to the general case: Since \( \Psi = (\sigma_1, \sigma_2) = 0 \) everywhere in \( Q \), therefore equality (29) becomes
\[
(\ell_1 u, \sigma_3)_{W^2_2(\Omega)} + (\ell_2 u, \sigma_4)_{L^2(\Omega)} + (\ell_3 \theta, \sigma_5)_{L^2(\Omega)} = 0. \quad (51)
\]
Since the three quantities in (51) vanish independently and since the ranges of the trace operators \( \ell_1, \ell_2, \) and \( \ell_3 \) are respectively everywhere dense in the spaces \( W^2_2(\Omega), L^2(\Omega), \) and \( L^2(\Omega) \), therefore it follows, from (51), that \( \sigma_3 = \sigma_4 = \sigma_5 = 0 \). Hence \( \tilde{R}(J) = H \). This achieves the proof of Theorem 4.

**Remark:** The following larger class of problems may handled by using the previous same techniques
\[
\begin{cases}
\mathcal{L}_1 u = \frac{\partial^2 u}{\partial x^2} + \triangle^2 u - \alpha \triangle \theta + (c_1 u + c_2 u_t) = f(x, y, t, \theta, u), \quad (x, y, t) \in Q, \\
\mathcal{L}_2 \theta = \beta \frac{\partial \theta}{\partial t} - \eta \triangle \theta + \sigma \theta + \alpha \Delta u_t - c_3 \Delta u = g(x, y, t, \theta, u), \quad (x, y, t) \in Q, \\
u(x, y, 0) = u_0(x, y), \quad u_t(x, y, 0) = u_1(x, y), \quad \theta(x, y, 0) = \theta_0(x, y), \\
u(0, y, t) = 0, \quad u(a, y, t) = 0, \quad 0 < y < b, \quad 0 < t < T, \\
u(x, 0, t) = 0, \quad u(x, b, t) = 0, \quad 0 < x < a, \quad 0 < t < T, \\
f^a \int_0^a x^k u dx = 0, \quad f^b \int_0^b y^k u dy = 0, \quad f^a \int_0^a x^k \theta dx = 0, \quad f^b \int_0^b y^k \theta dy = 0, \quad k = 0, 1, 
\end{cases}
\]
(47)
where the functions \( f \) and \( g \) satisfy the conditions
\[
|f(x, y, t, \theta_1, u_1) - f(x, y, t, \theta_2, u_2)| \leq \mu \left( |\theta_1 - \theta_2| + |u_1 - u_2| \right),
\]
\[
|g(x, y, t, \theta_1, u_1) - g(x, y, t, \theta_2, u_2)| \leq \mu \left( |\theta_1 - \theta_2| + |u_1 - u_2| \right),
\]
and \( \alpha, \beta, \eta, \sigma, c_1 \) and \( c_2 \) are positive constants.

We first deal with the associated linear problem, that is when \( f(x, y, t, \theta, u) = f(x, y, t) \) and \( g(x, y, t, \theta, u) = g(x, y, t) \) and then, on the basis of the obtained results of the linear problem, we apply an iterative process to establish the existence and uniqueness of the nonlinear problem.
